WHY KEEP SHIPS CLEAN

Large Colonies of Barnacles, Muscles, Tube Worms and Other Organisms Cause Ships To Drag and Burn More Fuel Leading To Significant Economic And Environmental Cost.

The US Navy Estimated That Barnacle Growth and Biofouling on Ships Increases Weight Significantly and Increases Drag By As Much As 60%

This Results In As Much As 40% Increase In Fuel Consumption

Top Speed Is Reduced

Invasive Organisms Are Transported to Unintended Locations

The 2010 Proof of Concept

In May of 2010 testing was done on the SS Cape Chalmers

The findings were very positive.

After two days there was a major reduction in barnacles and other crustaceans attached to hull

After 24 hours the barnacles began to slide off

After 36 hours the barnacles began to detach all together

Most of the biofouling lost its ability to bond to the surface of the ship

The rest were able to be removed with minimal labor and no loss of paint

No chemicals were needed to obtain excellent results

Environmentally friendly

What The HydroMaxx Pro System Does

In short, the HydroMaxx Pro system injects controlled waves and frequencies of electrons into the water

This changes the water at the molecular level which eliminates the ability of harmful elements to bond. Instead, it puts them into suspension

Depending on the target of the system, custom settings are deployed

Conclusion and Lost Data

- The main contact who ran the testing passed away unexpectedly
- Unfortunately, we do not have access to the actual data.
- However, the informal documents indicate that everyone involved with this test was very impressed.

NEXT STEPS

Present to The US Navy to and rerun proof of concept

Present to ship owners worldwide to demonstrate potential savings
